Air Nozzle

***Important***

The Air Nozzle must be thoroughly cleaned before being used for the first time to avoid any paint contamination.

Best Practices: Please remember that the operation of the Air Nozzle is only as good as the quality of the air that is supplied to them. The Air Nozzle must only be operated using clean, dry, regulated, and filtered air. The filter must be capable of removing particulates and oil carry over. Recommended air pressure is 50 psi.

Moisture and dirt in the air lines will cause contamination to the Air Nozzle and the paint surface to be dried. Before attaching the air hose to the air supply, the hose must be blown clear of dirt and moisture.

Be cautious when attaching the Air Nozzle to a shut off valve or a quick connect fitting. Do not over tighten or the plastic threads will be damaged and no longer allow for proper attachment.

To properly clean the Air Nozzle before first use:

1) Clean all surfaces thoroughly with a cleaner that your paint manufacturer recommends, then allow to dry. Do not soak the Air Nozzle. It is composed of ABS Plastic and will degrade if exposed to cleaners for long periods of time.
2) Blow plenty of air through the Air Nozzle before using.

Maintenance:
Before each use, Clean the Air Nozzle as it becomes dirty.

Caution: Never immerse or soak the Air Nozzle in solvent for cleaning or damage will result.
